

High Dose NAD+ Patch WITHOUT the needles

Unlock the Future of NAD+ Supplementation

A cutting edge 12 hour transdermal NAD+
delivery system

Push Patch is the industry leader in the use of iontophoresis technology for the delivery of peptides and coenzymes that may be beneficial for a variety of different conditions. By utilizing the slow release and direct to bloodstream advantage of iontophoresis clinicians are able to maximize the **time under dose** and pharmacokinetics of a variety of these products that in most situations have very short half-lives thus making other methods of administration of the exact same products less than ideal.

Push Patch employs iontophoresis, utilizing minimal electrical charges to transmit medication through the skin-absolutely pain-free. Think of it as a magnet-like operation, but with two electrodes instead of magnets. Applying the patch initiates a charge, propelling the medication through your skin and directly into your bloodstream. This is advantageous as it evades the gastrointestinal system, where medication is often compromised.
