

Infographic Guide to Weight Loss Support: What Your Patients Should Know

When patients ask about weight management, share the facts and what works, from IV therapy to peptides like Semaglutide and Tirzepatide.

THE FACTS

IV Therapy

83% of people in the US have received some form of IV therapy or infusion.

Injectables

64% of Americans who have taken weight loss injections report them to be either "extremely effective" or "effective" at helping them lose weight.

DELIVERY

Intravenous Infusion

Subcutaneous or Intramuscular Injection

TYPES

B12, B-Complex, Vitamin C, Magnesium and MIC (methionine, inositol, choline)

Tirzepatide, Semaglutide, Other Peptides

BENEFITS

- Higher doses of vitamins, minerals, and medications possible
- Rapid absorption and effects
- Energy boost
- Customizable to patient needs
- Gradual weight loss

- Convenient and quick administration
- Faster weight loss
- Self-administration possible with training
- Generally less expensive than IV

CONSIDERATIONS

- Requires medical supervision
- May take longer per session (20 minutes on average)
- Typically more expensive than injections
- Slower weight loss

- Lower doses of medications compared to IV
- May require more frequent administration
- Potential for injection site reactions

WHEN DO YOU LOSE WEIGHT?

IV therapy providers recommend using weight loss IV treatments 1-2 times per month to support ongoing weight loss efforts.

After 3 months:
Tirzepatide users lost about 6% of body weight on average

Semaglutide users lost less than 4% on average
